In english:

I took a closer look at the heater. The link with the magnetron list shows that the heating voltages start at one volt.

<http://www.hts-homepage.de/Wehrmacht/Magnetronliste.html>

I set this voltage at the beginning with my control transformer, which I connected before the line transformer in the picture. With this voltage, the tube was already nice glowing and I didn't go higher. It was almost 1V heating voltage.

Best regards

Karl
